

Evaporative Condensers

Energy-efficient evaporative condenser is one energy-saving heat exchange equipment based on advanced heat exchanging technology; it integrates traditional condenser, cooling tower, water circulating pump, pool and connecting water pipe. There are many advantages such as Jess land occupied, convenient installation, low noise, water and electricity saving, investment saving, low running cost, non-pollution, long life and easy repairing, it is the new-generation environmental protected product, desirable replacement of traditional shell and tube condenser, as well as it's the best choice for enterprises in chemical industry, medicine, industrial refrigeration, beer, beverage and food low-temperature processing and building air conditioner refrigeration.

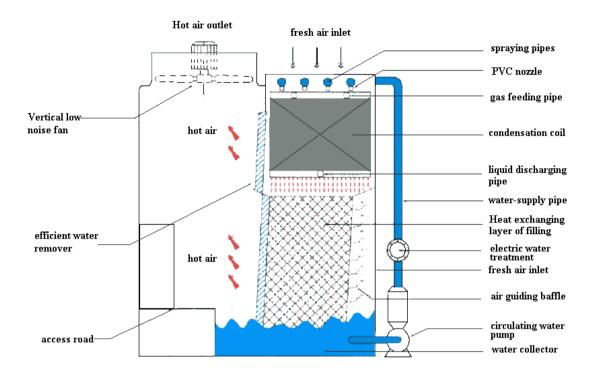

Running Principle

high-temperature gaseous refrigerant in the coils transfers heat with air and spraying water outside it. The refrigerant is condensed from gas to liquid state gradually. Thanks to the powerful fan and special design of the coil, spraying water covers the surface of coils completely. The effectiveness of heat exchange is obvious. The temperature of spraying water and air rise after absorb heat. Partial water transfer to gas. Taking away vast amounts of heat. The water in hot air is prevented by baffle and is collected in PVC heat transferring layer. Those water is cooled by flowed air, and fall into collective groove. Then it is pumped

into spraying system and circulate again. Lost water is supplied by water level regulator.

Features

◆ Wide application – superior performance and complete specification

Utilize perfect combination of condensation coils and feeding heat exchange layer, cooling water touches condensation coils to the full by air in taking from the top side, which overcomes "dry point" of water film in pipe wall and scale deposit is easy to appear on the wall, realizes heat exchange efficiently. (Its heat exchange efficiency is improved by 4 times based on speculated parameters of evaporative condenser for ammonia refrigeration of the national standard of 7658.5-95), it can run for long time and absolutely saves water and energy.

As setting feeding heat exchange layer, temperature of circulated cooling water will not raise as environment temperature goes up, which cause high exhaust pressure and low efficiency of heat exchange. Cooling water can be dropped to 5° C, it guarantees temperature exchange and improves heat exchange on unit area.

STZ evaporative condensers heat rejection is from 295KW to 2245KW, complete specification and meet requirements of different customers and conditions.

◆ Low cost of installation and convenient installation

Fans use direct-coupled structure with simple layout, low noise, no transmission loss, high efficiency, and little friction among parts, which overcomes installation and maintenance difficulties caused by complex drive system.

STZ evaporative condenser integrates condenser, cooling tower, water circulating pump, pool with water connecting pipe assembled by way of upper and lower standard boxes with base of equipment. It is place on the floor or ceiling or overlap arranged with fluid container, and STZ evaporative condenser could remove your trouble of inadequate locations.

◆ Long life- good and durable quality

STZ condensation coils is made of stainless pipes, it pass 2.5MPa pressure test in water and super thick hot galvanizing after assembling, which ensures long life for running.

Body case is made of import super thick double-surface hot galvanizing steel, which is the highest standard of galvanized sheet in industry, thickness of which is 0.05mm with zinc-rich paint on both sides of sheet. Feeding heat exchange layer use PVC honeycomb cross-flow feeding. Its special S-model design makes large flowing membrane on feeding surface, which prolongs staying time of water and improves water cooling and life without aging and deformation.

◆ Low cost in maintenance-simple maintenance and high reliability

You can repair floating valve and clean filtering mesh without stopping STZ evaporative condenser, and its special repairing tunnel is convenient for check and clean of internal structure. Its outsider repairing staircase facilitates checking and repairing of fan and spraying devices on top.

There is no friction running parts in STZ evaporative condenser except in water pump and fan axial, which applies IP55 outdoor and full-closed water-proof electric machine and good bearings, therefore, fault rate is low.

◆ Low cost in running-low cost, environmental-protection and energy-conservation

As STZ evaporative condenser has special structure, good quality and many advantages especially in areas with high humidity and high temperature, therefore STZ evaporative condenser is your best choice.

Evaporative condenser has special heat performance (heat removing volume in unit area is 3 times that of water cooled shell and tube condenser) and low condensing temperature; its water recycling device gets 0.001% elegant rate of cooled water with little consumption of cooled water, small running power and electricity-saving; absolutely low annual running fee. With low noise and environmental-protection, it is real energy-conserving and environmental-protecting products.

Introduction of Major Parts

Circulating water pump it applies mechanical sealing with long life, outdoor-machine with special bearings guaranteeing reliable running. It has large flow, low power, low noise and good performance.

Electric water treating instrument: Equipped with advanced electric water treating instrument, you can start the function of decaling, derusting and disinfection of condenser when put through of 220V power and make cooling water clean.

Vertical axial ventilator: ventilation system is aluminum-alloy axial ventilator for cooling tower and top wind-leaf structure, which has small wind resistance, large blast, low noise, good performance and high efficiency. And wind-leaf can be directly installed on the machine, which reduces driving parts. The machine applies full-closed, self-cooling and low-noise special cooling tower with protection class of lp55, which is small in volume, light in weight, good in performance and durable in running.

S-shaped condensing coil pipe: made by oval seamless steel, and each route is installed after checked to guarantee material quality and pressure, and coil pipe passes 2.5 MPa pressure test to guarantee no leakage. It applies superthick integral hot galvanizing with strong corrosion.

Advanced water distribution system: spraying system of cooling water applies large-flow PVC nozzle, which

guarantees continuous flow on coil pipe surface and avoids "dry point" of water membrane of condensing pipe, improves sprinkling and heat exchanging effect.

Efficient dehydrator: it applies specially designed corrosion glass steel, whose structure can remove wet air from coil pipe by changing flowing direction and make elegant rate up to 0.001%.

Good PVC feeding: it applies PVC honey-comb cross feeding, and its shortcut inletting design can quickly take heat of water and special feeding route can form large flowing membrane on feeding surface and extends staying time of water in feeding and improve cooling

effect, while feeding is resistant to 68°C water with good flame resistance, small wind coefficients, anti-aging and anti-deformation.

Efficient flat-tube radiating coil pipes: flat and oval tube design makes compact arrangement and small pipe gap, and pipe area in unit space will be larger, air resistance will be smaller, and heat exchanging between pipes and water more longer and completer. Compared with other factories, it has more exchanging area and volume in unit time.

Overall Dimension Sketch of the STZ Series Evaporative Condenser

Attention in Installation

- 1. Check loading capacity of the foundation according to running weight and safety coefficients of condenser.
- 2. Units must be installed on top of buildings or grounds with good ventilation. There are no air reflows if installed in places with obstacles around.
- 3. Pipe design and installation must correspond to national standards. Pipes should be symmetrically arranged in multi-units system, whose size should be considered according to flowing speed and low-pressure.
- 4. The easiest and valid method for circulating system to prevent frost is distant storage slot installation in the room, or install electric, steam or hot-water heater on bottom slot. In low temperature in winter, wind-cooled could replace water-cooled with dry-running

mode (water pump out of work while fans work). In the same time, water must be evacuated form slot emptily and electric heater is not in working.

Maintenance for Units Running

- 1. Circulating water system. As evaporation of partial spraying water, mineral and other impurity in water are left, therefore, must drain and clean the impurity regularly.
- Control of biological pollution. Examine water quality of biological pollution regularly and take farther treatment flow water ad mechanical cleaning program if biological pollution is detected. Keep surface clean without pollution and impurity, make water collector is in good working status.
- 3. Water treatment. If mineral content of supplementary water is high and cannot be removed by draining method, ask relevant treating company to deal with the problem. If use chemical to remove impurity, the chemical can't destroy galvanizing layer of components.
